Visual Maintenance Guide

The system on five diagrams:

- 1 - How the whole system fits together
- 2 - The three editing layers and who wins
- 3 - Publishing a change
- 4 - How an email alert happens
- 5 - Troubleshooting: where to start

Written companion: MAINTENANCE.md in the repository root.

Content format: content/README.md - Cloud setup: supabase/SETUP-GUIDE.md

1 · How the whole system fits together

Two independent halves: static files served by GitHub Pages, and one Supabase project holding everything that changes. Either half can be replaced without touching the other.

Emails fire on schedule even when nobody has the site open — the scheduler lives in the cloud, not the browser.

2 · The three editing layers & who wins

Same content, three doors. Higher layers override lower ones per task; "Revert to built-in" in the edit drawer removes a browser override.

LAYER 1 · WINS

Browser editing — managers, on any task page. Text boxes, learn cards, steps, embed links.

saved in: content_overrides table
live for everyone instantly

LAYER 2

content/*.md files — quizzes, new tasks, bulk edits. Then: node content/tools/build.js

saved in: git repo
live after git push

LAYER 3

Code — engines, cloud sync, dashboard. assets/js/*.js and page HTML. (Ask Claude.)

saved in: git repo
rarely needs touching

3 · Publishing a change

For anything edited in files (layers 2–3). Browser edits (layer 1) skip this entirely — they're live on save.

4 · How an email alert happens

Everything configurable lives in the dashboard's Alerts tab; everything automatic runs in the cloud. The email log is the audit trail when anything looks off.

5 · When something's wrong, start here

Three symptoms cover nearly every incident. Follow a column top to bottom.
